	Key Process: ISOLATION Cleaning: Imaging Portable Procedures Trigger: Isolation Patient Exam	Performed By: Imaging Staff Owner: EVS/Img V: 1.1 3/23/20	Next Review April 2021	
Timing	Major Steps	Key Points	Notes	
At end of Procedure, While in Patient Room	1. Dispose of cassette covers and other used supplies in patient room	1. Dispose of waste as you normally would via regular trash, red bag waste, sharps etc.		
While Exiting the isolation room	2. Doff PPE just inside the patient room 3. Don Clean gloves. 4. Exit the room with the portable equipment	1. Move the portable equipment to the edge of the room near the door. 2. Follow Donning/Doffing guidelines in PPE/Masking Toolkit on Intermountain.net		
AFTER Exiting the isolation room	5. Don appropriate clean PPE	1. Gloves always 2. Gown and Eye protection if splash is possible or if gross contamination exists		
	6. BEGIN CLEANING AND DISINFECTION PROCEDURE	1. If any surfaces are soiled, you must clean the surface first and then disinfect with the appropriate disinfectant wipes.	Clean the equipment as near the isolation area as possible to avoid potential contamination by traveling through hallways, in elevators, etc.	
	7. Use appropriate disinfectant wipes	★ 1. Disinfectant must stay wet and be allowed to sit for the specified wet dwell time to be effective. Resaturate if disinfectant evaporates too soon.	Purple top = 2 min Gray top = 3 min Bleach = 4 min (required for C-diff)	
	8. Surfaces, controls, monitors, accessory equipment, etc.	1. Maintain Wet time	Always clean from top to bottom and cleanest to dirtiest	
	9. Wheel treads	1. Only need to be cleaned if rolled through a large body fluid spill.	Only cleaning (not disinfection) is necessary.
